

MODULE 1 - INSTALL

Dashboard Tour - Reference

What lives where on your hosted brain dashboard, with one paragraph per section.

Version: v1 - 2026-05-09

Dashboard Tour - Reference

The hosted brain dashboard is your operations console. Every section has a job. Print this or keep it open in a tab the first week - it is faster than re-reading the docs.

1. Top bar

Handle and avatar on the right. Search box in the center - searches across every file plus memory entries plus session handoffs. Quick action menu on the left for the most common writes (append memory, append daily log, append decision).

2. File tree (left rail)

Every file in your brain. Click to open. Folders match the templates structure: top-level files, then memory-types/, then your own subdirectories as you add them. The tree mirrors the API exactly - what you see here is what an agent gets when it calls `/v1/brain/index`.

3. Inline viewer (center)

Markdown rendered with proper headings, lists, and code blocks. Edit button switches to inline editor. Saves use ETag-based optimistic locking - if an agent wrote the file while you were editing, you see a conflict toast instead of a silent overwrite.

4. Activity feed (right rail)

Reads from your audit log. Every write any agent or human made, newest first. Each row shows the actor (which API key or which user), the action (write, append, memory.append), and the file or entry touched. Click any row to jump to the file at that revision.

5. Memory section

Top-level shortcut to MEMORY.md and the four memory-types files. The append-memory form is one click away from any page - the friction has to be near zero, otherwise you stop writing memory.

6. API keys

Issue, name, and revoke keys. Full key value shown once on issue. After that you see only the prefix, the name, and last-used timestamp. Revoke is immediate - no grace, no soft delete.

7. Export

Always-on. One click downloads a tarball of every file in your brain - markdown, JSON, everything. The tarball is git init-able. If you cancel the subscription, this endpoint stays open during the 90-day grace and the 12-month suspended window. Your brain is yours.

8. Settings

Email, time zone, billing portal link, custom domain (Phase 2+ only). Plan tier is shown but not editable here - upgrade or downgrade flows through the billing portal.

Tour complete. The dashboard is the surface; the API is the substrate. Whatever you do here, an agent can do via REST. Whatever an agent does, you see here in the activity feed.
